Feed back into

Feedback into in spanish. Feed the power back into the melancholy soul. Feeding energy back into the grid. Feeding electricity back into the grid. Feed power back into the grid. Feed back into meaning. Feed back into the grid. Feed back into synonym.

I have 10 power stations in my garden and I love to help others create feeders for local birds in their area. One of the pleasures of the summer is to watch the crocodile manger from the kitchen window. Now that the mating season is over, and the little ones are gone, there are fewer fights and the males are satisfied (usually) to divide the manger with the females and small birds. In the early morning and at sunset, all 10 my power stations are busy, with one or two hummer waiting for a place. A one-quarter large power supply is emptied in about a day. At the beginning of spring, and after the main migration in autumn, I use a smaller power supply. I used to have more power stations, but they got too hard to keep up with! In this article, I will share with you some important points to consider when you set a food for humming in your garden. This article will share all the information you need to know to set a food for hummingbirds in your garden.5 Installation tips: Here are some of the main factors to consider when setting up on a colibris feeder:1. Attention to insectsThe hummingbirds live of small insects such as aphids, spiders and «no-see-ums», but larger insects can be a threat to them. Bees and wasp bites can be fatal, so aragosts will avoid feeding when these insects are present. Great spiders and mantids will catch and eat lobsters, so the eaters must be kept away from their hiding places! Ants are not a problem for themselves, but tend to drown inside the feeders.Ant Guardie and Api Guardie eliminate most problems. The anti-form guards are barriers full of oil, water or insecticide, which are blocked between the power supply and the line, preventing ants from forming a trail towards the power supply. Some mangers with large artificial flowers will attract bees and wasps, and these need protectors for bees (like knitted fingers) that go over the holes of the nectar. These prevent bees from reaching the nectar allowing the Hummers to lick it with their long tongues. Most new power supplies eliminate this problem by replacing the flowers with a small slot opening. The hummingbirds have excellent views and will find opening, but bees and wasps usually no.2. Attention to other parasitesMy two bigger parasites are orioles and spikes. I love both birds, but not hummer eaters! In addition to frightening all hummers, their weight tends to flip the power supply sideways, allowing a nectar flow to escape. This wastes nectar and attracts ants. The ores are only around for one or two weeks in spring and autumn, but theLanosis is a perpetual nuisance. Last year, I had a couple of good power supplies with removable drinking sockets, which made them easy to clean. The peaks thought that the ports hindered their ability to reach the nectar, so they pulled them out systematically and threw them out in the yard. This year, I switched to the power supplies with the drinking ports permanently fixed. I also put a weather dome over the power supply. He's not there for thethe power supply is hung under the eaves of the roof of the rear porch, but the dome makes it more difficult for the peaks to descend from the roof to the power supply. A couple of years ago, I looked out of my kitchen window and I would have sworn that a tabby cat was hanging from the Hummer power supply. My misty brain (it was before my first cup of morning coffee) took a couple of seconds to fix the image in a sapsucker from the yellow belly. Fortunately for me, he was not planning to take permanent residence in my courtyard and left after a couple of days to be sprayed with kitchen sink spray nozzle. The hummingbirds looked up! Power supplies should be easy to clean.3. Keep cleanThe food supplies for hummingbirds must be kept clean by insects and molds, so a good power supply should disassemble easily. There should not be parts with too small openings to get a toothbrush, or you are inside for a terrible time of cleaning! This is the most important consideration when selecting a power supply. The power supplies must be cleaned every time there is evidence of mold. In the cold season, this can be once a week, but it can be every day in the summer heat. If you are not ready to clean the mangers, it would be better not to install one because the contamination in the nectar can make the hummingbirds sick. The boiling or sterilisation of pumpkin water will not stop contamination, since the hummingbirds bring it directly to the tongue. The best way to clean a power supply is with sodium bicarbonate or neutral soap (not detergent), rinse thoroughly. A bottle toothbrush or an old toothbrush is useful to bypass the edges. After cleaning with sodium bicarbonate, a little apple vinegar will foam the remaining sodium bicarbonate, while vinegar helps to sterilize the parts of the power supply.5. The biggest, the best Small Powers that contain 3/4 ounces of nectar look cute, and you might think, "how much nectar can eat a hummer or two a day?" But around my house, one of those eaters would be empty in less than an hour. If you live in an urban area, where the hummingbirds pass only occasionally, these small power supplies could be right. On the other hand, if you have many hummingbirds, any power supply that contains less than 10 ounces is a waste of time. Get a larger power supply (some have half gallon!) and do not fill it with more nectar than the hummingbirds will drink in two days (one day in the hot season.) As your feeder attracts more birds, you will be happy for the larger size. There is a smaller power supply (8 €14 ounces) that sticks to a window with suction cups. This is a great choice if you want to get close to the birds as they feed. You can stayto a window with the power supply outside, and the birds will simply ignore you. (They see you, but they also see the window.) The biggest problem with these, apart from their small size, is that ants will find the mangers unless you put a barrier of some kind around the window. These power supplies can also jump out in case of strong winds. Do not serve your colybian any artificial coloringcolorants! do not add red food dye to the nectar or buy colored prepared nectar. no in-depth studies have been conducted to show that the colorant is harmful, but the kidneys of a hummingbird are small and should not handle colorants in nature, since the nectar of the flowers is colorless. 6. color materials the hummingbirds control everything that is colored so that the feeders should not be red. an old favorite power supply around my house was purple with yellow power doors. Once the birds have found a manger, they will return. If they seem to have difficulty finding it, place ribbons or bright films on the line that holds the power supply (or in the window for a power supply) to attract their attention. Do not add red food dyes to the nectar or buy colored prepared nectar. There are no in-depth studies to show that coloring is harmful, but the kidneys of a hummingbird are small and should not handle coloring in nature since the nectar of flowers is colorless. Why put in something that doesn't help anything and that could be harmful to birds? and many red colorants contain propylene glycol: antifreeze. the hummingbirds migrate into the cold weather, so they don't need antifreeze!3 common questions about the Feeders:1. when is the best time to hang the manger? Enter the feeders a few days before the arrival of the hummingbirds in your area, so that they have a little "fast energy" after the long flight. If you don't know when they get to your area, check the migration maps. the hummingbirds will return to the area in which they lived the previous year and will look for the "their" shepherds. If you're late hanging the mangers, you may see hummingbirds where the power supply had been the year before. Take the feeders after the first frost in your area. It's a myth that keeping power supplies up encourages hummers to stay rather than migrate. migration is triggered by the length of the day, not by the availability of food. Keep power supply up and filled in the fall will help migratory birds with quick energy for their flight.2. What's going on in the Feeder? The nectar is a mixture of a part of pure cane sugar to four parts of boiling water (or otherwise purified). Experts say that you can smell tap water if you drink alone, you don't need to boil water if it is drinking, add sugar and make sure it is completely dissolved. nothing else should be added. never oare no substitute for sugar since these lack the carbohydrates that birds need for fuel. Never hate honey because it contains a mold that will kill the hummingbirds. Do not change the relationship: a weaker mixture will be ignored by birds in favor of nectar of flowers, and a stronger mixture has too little water forcorrect kidney function. Do not buy the mixtures prepared commercially because these are a waste of money and most contain red coloring. Some special mixtures contain added nutrients, which can be useful to wildlife specialists who deal with sick or wintering birds. For the average domestic user, I am not need. The hummingbirds get all the nutrients they need fromThey eat. They only get energy from the nectar, and the mixture 1-to-4 is very close to the natural flower nectar.3. Should I buy a power supply with the 'causes? Some people love to watch birds hoooves while drinking from the feeders, so as to eliminate crowds. On the other hand, it helps the birds save energy if they can sit on a perch during feeding, and I would recommend feeders with dip. At first light, the hummingbirds are in turpe from the long night without food. Those who show up to my feeders look a lot like me before my first coffee shot, a little extravagant! They will sit on a perch for 10 minutes, slowly sipping their morning energy boost before flying away. There's usually a waiting line for a porter, and birds will sometimes share a reason with offspring or brothers, especially the first thing in the morning. Put your power supplies a few days before the brigades are planned to arrive in your area will provide them with some "fast energy" after their long flight. No power supply? No problem! There are a lot of plants that attract hummingbirds. Basically, any flowering plant that produces nectar will be visited by hummingbirds, but especially as tubular flowers. Some plants loved by hummingbirds include bees balm, sage, olyhock, fuchsia, columbina, nicotiana, petunia, gladiolus, butterfly grass, cardinal flower, lupine, honeysuckle, trumpet lives, camps, morning glory, lilac, quince, weigela, azalia, butterfly bush, silk trees (mimosas), and flowers. Remember that the hummingbirds live on small insects, not just nectar. Overspraying with toxic insecticides will leave hummers without food source, and will not remain in your area, even with abundant nectar nutrients. This content is accurate and true for the best of the author's knowledge and is not intended to replace formal and individualized advice from a qualified professional. Amie on 02 July 2012: Orioles loves nectar even if it has stands and the HUMMERS are not afraid of the big birds. So you can still have both. I have a power supply and hummers also try to scare the orifices. RockBlossom (author) from The Arkansas Ozarks on December 17, 2011:Russ:Show map: ... It is not rare to see hummers in your area after the "normal" migration time. Sorry, there's no "antifreeze" I know you're not gonna kill hummers. I doubt they can survive temperatures under freezing, however, so if they did not migrate south before freezing. ..Russ on 17 December 2011: I keep reading that the hummers migrated south - but it's frozen out, December 17, and the hummers are at my food feeder! I think they're getting something or they don't care about the power supply, but I need to know what I can use for antifreeze in the power supply mix. Ourswill arrive in half twenty range of night and half thirty range during the day. The Hummers in West Washington don't seem to migrate. jwalkerprice fromOn 09 July 2011: Hi. This is a very informative article. I liked reading it as a research assistant for an ornithologist at Auburn University. We will test in the next few months on nutrition and performance of hummingbirds during the addition of electrolytes to food. I like you and some of the addresses comments the salts (electrolytes). It is interesting to feed so frequently before exhausting energy! Tyresenki on 30 April 2010: those are some good advice, especially those on cleaning. I found some superior fillers from Perky-Pet which are specifically designed for easy cleaning. What I found online: http://www.birdfeeders.com/store/hummingbird-feede...Rockblockom (author) from Arkansas Ozarks June 3, 2009: hah! I seem to be in the middle of a migration path for orioles. They go through the clusters, but they don't stay the summer. For the couple of weeks I'm here, they're parasites. They will wrap the Hummer power supply, even when hanging a perfectly good power supply a few meters away! He asks me if they recognize the Hummer power supply and know that he has Nettare, but they are not used to seeing the oriole power supplies. When they found out that the orifice feeder is easier to sit and has the nectar, they are heading north again. The hummers seem relieved to see them gone. The world of humours: says Nix on Kool aid. Since I will never understand Kool's help, I don't know what's in it, but I tend to make mistakes on the side of caution and leave out additives. Hummers only gets energy from the nectar - natural or power supply - and receive other nutrients from the insects. Some experts say that there are amounts of trace of potassium salts in the nectar of flowers, and small amounts can be added to the nectar of the power supply. I left out of my article for fear that readers could see "potassium salt" and confuse it with table salt (sodium). Adding table salt is a bad idea. Dolores Monet from East Coast, United States on June 3, 2009: so you call parasite orioles? I'd like to have an oriole visit my colibri power supply! I heard that people add a red Kool help, just a little, for color and nutrients to the nectar. Is that a good or bad idea? Great hub, rockblossom. I can't believe you were just here a week. Both of your hubs are very informative and detailed. Matt Couden of the United States on May 29, 2009: excellent lens and tips on hummingbirds. We also have a food for hummingbirds and one for birds out of the kitchen window..it can be a great way to start the day watching the window to nature while you have breakfast! Myra636 from Vignia on 28 May 2009: Thank you for coming from I liked reading about your birds forso much so
